Hydrometers are glass instruments used to determine the density (in Kg/m³) of any kind of solution. They consist of a bulb weighted with plumb and a graduated stem. The bulb sinks in the solution to be analysed depending on the density of such solution (the lower density of the liquid, the lower the hydrometer will sink) and the point where the surface of the liquid touches the stem of the hydrometer indicates the density of the solution. Nahita offers this complete series of hydrometers that cover a wide measuring range to determine the density of both, liquids dense than water.
